No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modified polylinker; Site 1: EcoR I; Site 2: Not I; UIB-ED0 is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes, AGAATCAAGA; lens, CGATTAGCGA; eye anterior segment, AAATGCGCAT; optic nerve, CCATTAAGTG; retina, CGCGCG; Retina Poveal and Macular, GTCC; RPE and Choroid, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LIML at: http://image.llnl.gov Series: IRAK Plate: 168 Row: o Column: 20
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 47132556
This clone has the following problem: frame shifted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Submitted (02-AUG-2004) National Institutes of Health, Gene Collection (MGC), Bethesda, MD 20892-2590, USA NIH-MGC Project URL: http://mgc.nci.nih.gov Contact: MGC help desk Email: cgapbs-r@mail.nih.gov

Generation and initial analysis of more than 15,000 full-length human and mouse CDNA sequences

Proc. Natl. Acad. Sci. U.S.A. 99 (26), 16899-16903 (2002)
                                                                                                                            Series: IRAK Plate: 198 Row: j Column: 21
This clone was selected for full length sequencing because passed the following selection criteria: matched mRNA gi: 4
This clone has the following problem: frame shifted.
                                                                                                                                                                                                                                                                                                                                                                   cDNA Library Arrayed by: The I.M.A.G.E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated bacterial protein that CC induces fibrin-dependent plasminogen activation in a pharmaceutical CC composition for dissolving blood clots. Also described are: (1) a CC composition comprising an isolated modified streptokinase recomposition comprising an isolated modified streptokinase, the CC modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising CC administering to the subject a fibrin-dependent streptokinase protesing an expression vector comprising (1); and (4) a host cell transformed with CC the expression vector of (3). The pharmaceutical composition comprising a modified bacterial streptokinase; (3) an CC expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving CC blood clots in patients with a thrombosic condition, e.g. myocardial CC infarction, venous thrombosis, plumonary embolism, cerebral thrombosis, CC graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of CC plasminogen is at least 10-fold, preferably 100-fold greater in the CC presence of fibrin than in the absence of fibrin. The modified constrate site for proteolytic cleavage. This reduces the rate of CC degradation of the streptokinase at least two-fold. The present sequence constraint in an example of the present mention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       No.:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 795

The sequence of the synthetic hirudin HV-1 genes was designed based on the published amino acid sequence (Dodt J., et al FEBS Letters 165 180 (1984)). The sequence of streptokinase was obtd. from RCR amplified chromosomal DNA from S. equisimilis ATCC 10009 or ATCC 9642. The primers used for the PCR were based on the pub- lished DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). The two sequences were used to construct an expression vector in which the hirudin gene is linked to the streptokinase gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring.
